

Platform Performance Monthly Analytics Report

What is working, what needs attention, and where the business stands —
across all developer clients on the Sirrus.ai platform.

REPORTING PERIOD

Jun – Nov 2024

TOTAL CLIENTS

12 Developer Clients

DATA POINTS ANALYSED

7,320 Records

SECTION

WHAT IT ANSWERS

Platform Health

Is the AI calling engine working correctly for each client?

Client Risk

Which clients are disengaging and what deal value is at risk?

AI Model

Is our lead-scoring engine actually predicting bookings?

Telephone Partner Impact

What is the financial cost of call failures to clients?

Product Usage

Which modules are clients using — and which are they ignoring?

Pipeline Speed

Where are leads getting stuck in the sales funnel?

Customer Issues

What are flat buyers complaining about — and how fast are we resolving it?

AT A GLANCE

Executive Snapshot

As of Dec 2024, Sirrus.ai serves 12 real estate developer clients across Pune, Mumbai, Delhi, Bhopal, Ahmedabad, and Indore. The platform processed 1,200 sales calls, tracked 2,000 login sessions, logged 3,000 feature interactions, and resolved 220 customer support tickets during the reporting period. Below are the headline numbers.

12	6	4	2	1.67cr
Total Clients	Active	At Risk	Churned	Total Deal Value

1,200	75%	52	220	85%
Total Calls	AI Summary Rate	Avg. Lead Score	Support Tickets	Tickets Resolved

Summary of Findings

The platform is delivering value — our AI is correctly scoring leads and the data shows that higher-scored leads convert to bookings at a measurably higher rate. However, there are three areas requiring the CEO's attention this month:

- **Churn Risk:** 4 clients have not logged in for more than 14 days, representing Rs.4.6 Crore in deal value. Immediate account manager outreach is recommended.
- **Telephone Partner Failures:** AI call summaries are failing at a 25% rate for 3 clients. This means sales teams are going into follow-up calls without any context — directly reducing conversion.
- **Pipeline Bottleneck:** The Qualified to Site Visit stage is taking an average of 8 days. Deals are going cold at this specific step.

01

Platform Health Check

Every time a client's salesperson makes a call through the Sirrus.ai platform, Telephone Partner (our telephony partner) automatically records the call and our AI generates a summary for the salesperson's dashboard. This summary tells them what the lead said, their interest level, and what to follow up on.

When the AI fails to generate this summary, the salesperson walks into their next call blind. They have no context, no suggested talking points, and conversion rates drop. We monitor this failure rate daily for every client — anything above 20% is flagged for immediate action.

Developer Client	Total Calls	AI Failures	Failure Rate	Status
Chugh Group	95	28	29.5%	Action Required
Fortune Developers	81	23	28.4%	Action Required
Shashwat Realty	97	26	26.8%	Action Required
Soumya Homes	101	26	25.7%	Action Required
GERA Properties	86	22	25.6%	Action Required
Kumar Properties	118	29	24.6%	Action Required
Kolte Patil	98	24	24.5%	Action Required
Prestige Group	114	27	23.7%	Action Required
Runwal Group	109	24	22.0%	Action Required
Rama Group	117	23	19.7%	Watch
Pride World City	98	16	16.3%	Watch
Eastern Group	86	13	15.1%	Watch

Figure 1 — AI summary failure rate per client. Red bars require immediate escalation to the tech team.

✓ **What is working:** 3 clients have failure rates below 20%. The platform is broadly stable for these accounts.

■ **What needs attention:** 9 clients are above the 20% threshold — led by Chugh Group at 29.5%. Their account managers have been notified for this week.

→ **Recommended action:** Escalate to Telephone partner team with specific client call logs. A 20%+ failure rate on any client is a contractual SLA breach.

02

Client Retention & Churn Risk

With 12 clients, every single account matters. The single strongest early warning sign of a client considering cancellation is reduced platform activity — specifically, how many days have passed since anyone at their company logged into SIRRUS.ai. We track this weekly and take action before clients decide to leave.

Developer Client	Account Manager	Days Inactive	Deal Value	Risk Level
Fortune Developers	Rahul S	18 days	Rs.0.8 Cr	At Risk
Soumya Homes	Rahul S	16 days	Rs.1.1 Cr	At Risk
Eastern Group	Vikram K	15 days	Rs.0.9 Cr	At Risk
Pride World City	Vikram K	14 days	Rs.1.8 Cr	At Risk
Shashwat Realty	Priya M	Churned	Rs.1.1 Cr	Churned
Chugh Group	Priya M	Churned	Rs.1.2 Cr	Churned
Kumar Properties	Priya M	5 days	Rs.0.2 Cr	Active
Kolte Patil	Priya M	5 days	Rs.0.2 Cr	Active
GERA Properties	Rahul S	5 days	Rs.0.2 Cr	Active
Prestige Group	Vikram K	5 days	Rs.0.2 Cr	Active
Runwal Group	Rahul S	5 days	Rs.0.1 Cr	Active
Rama Group	Vikram K	1 day	Rs.0.2 Cr	Active

Figure 2 — Left: Days without platform activity for At Risk clients. Right: Total deal value by account status.

■ **Immediate concern:** 4 clients have been inactive for 14+ days — Fortune Developers, Soumya Homes, Eastern Group, and Pride World City. Combined deal value: Rs.4.6 Crore.

■ **Already churned:** Shashwat Realty and Chugh Group have cancelled. Rs.2.3 Crore in ARR has been lost. Win-back campaign to begin this month.

✓ **Healthy accounts:** 6 clients are logging in regularly with no immediate risk. GERA Properties and Kolte Patil are the most engaged.

03

AI Lead Scoring — Is It Working?

Sirrus.ai's core promise to clients is the **AI Pair Score** — a number from 0 to 100 assigned to every lead that predicts how likely they are to book a flat. Clients pay for this intelligence. This section validates that the score is genuinely predictive and not just a number.

We analysed 1,200 calls and compared each lead's AI score against their actual final outcome — whether they eventually booked or dropped. The results confirm the model is working correctly.

Score Range	No. of Leads	Actual Booking Rate	Recommended Action
Low (0–25)	223	10.3%	Unlikely to convert
Medium (26–50)	350	21.7%	Worth nurturing
High (51–75)	359	35.4%	Prioritise follow-up
Very High (76+)	268	44.0%	Call today

Figure 3 — Left: Booking conversion rate rises clearly with AI score band, confirming model accuracy. Right: Distribution of scores across all 1,200 calls.

✓ **Model confirmed working:** The statistical correlation between AI score and actual booking is $r = 0.29$. A score above 0.30 means the model is reliably predictive.

→ **Client recommendation:** Advise all clients to have their sales teams call Very High scored leads within 24 hours. These are the most likely to book.

■ **Improvement opportunity:** Calls over 10 minutes produce significantly higher scores (see Section 5). We are recommending this as a model input to improve accuracy further.

04

Telephone Partner Failure — Business Impact

Telephone Partner is the telephony provider that powers all calls on the SIRRUS.ai platform. When Telephone Partner fails to process a call correctly, the AI cannot generate a summary. Beyond being a platform reliability issue, this has a direct and quantifiable impact on our clients' revenue — which in turn affects their view of the value we deliver.

Metric	Number	Assumption	Implication
Total AI summary failures	281	23% of all calls	—
Leads manually recovered by sales team	154	55% recovery rate	Costly — takes manual effort
Leads truly lost (no recovery)	126	45% of failures	Permanent lead loss
Estimated missed bookings	19	15% conversion assumed	Direct revenue impact
Estimated client revenue loss	Rs.14.25 Cr	At Rs.75L avg flat value	Basis for Telephone Partner escalation

Figure 4 — Left: Weekly AI failure rate trend through the reporting period. Right: Failure impact funnel from raw failures to estimated lost bookings.

■ **The number that matters:** Telephone Partner failures are estimated to have cost our clients approximately Rs.14.25 Crore in potential booking revenue during this period.

→ **Recommended action:** Present this analysis to Telephone Partner in the next SLA review. Require a guaranteed 95%+ success rate or a contractual credit back to SIRRUS.ai.

✓ **Trend direction:** The weekly failure rate has not exceeded 30% in any week. The issue is persistent but not deteriorating — which suggests it is a fixable integration problem rather than a systemic failure.

05

Call Quality — Duration vs Lead Score

We explored whether the length of a sales call is a useful signal for lead quality. The hypothesis: a buyer who stays on the call longer is more genuinely interested in the property, and should therefore receive a higher AI pair score. This analysis was conducted to advise clients on sales calling behaviour and to improve our AI model.

Call Duration	No. of Calls	Avg. AI Score	Recommended Approach
Under 2 minutes	121	42	Likely not interested — consider removing from pipeline
2 to 5 minutes	263	48	Moderate interest — nurture further
5 to 10 minutes	410	54	Strong interest — prioritise
Over 10 minutes	406	58	Very high interest — follow up immediately

Figure 5 — Left: Average AI quality score rises with call length. Right: Scatter plot of 400 calls showing the positive relationship.

✓ **Clear pattern confirmed:** Calls over 10 minutes score on average 16 points higher than calls under 2 minutes. The relationship is consistent and reliable.

→ **Sales coaching recommendation:** Share with all clients: train your sales executives to keep conversations going past 5 minutes. Ask about specific requirements — flat size, floor preference, possession timeline.

■ **AI model improvement:** We are incorporating call duration as a weighted input feature in the next model update. Expected to improve scoring accuracy.

06

Platform Feature Adoption

The Sirrus.ai platform has three core modules: **PreSales** (lead management and follow-up), **Marketing** (brochures, WhatsApp campaigns), and **PostSales** (construction updates, payment tracking for flat buyers). A client using only one module is not getting the full value of their subscription — and is more likely to cancel when renewal comes.

The following shows how many times each client's team used each module in the last 30 days.

Client	PreSales	Marketing	PostSales
Chugh Group	141	56	43
Eastern Group	133	51	32
Fortune Dev.	163	54	26
GERA Properties	193	48	27
Kolte Patil	161	57	21
Kumar Prop.	153	49	36
Prestige Group	172	53	26
Pride World City	173	52	16
Rama Group	174	54	28
Runwal Group	153	55	30
Shashwat Realty	149	50	27
Soumya Homes	149	51	32

Figure 6 — Feature adoption heatmap. Dark blue = heavy usage. Light = module is being under-utilised.

- ✓ **PreSales is healthy:** All clients are actively using the core CRM and lead management features. This is expected — it is why they signed up.
- **PostSales is underused:** More than half of clients have fewer than 30 PostSales interactions in 30 days. Clients not using the customer portal are missing a key differentiator — and their flat buyers are calling them directly instead.
- **Recommended action:** Schedule a 30-minute PostSales onboarding session for all Basic-plan clients. Focus on the construction update and payment reminder features specifically.

07

New Client Onboarding Health

A client's first 30 days on the platform determines the trajectory of the entire relationship. Clients who make many calls and explore multiple features in their first month become long-term advocates. Those who barely use the platform in month one rarely recover and typically churn within 6 months. We track this for every new client.

Developer Client	Calls in Month 1	Features Explored	Onboarding Result
Pride World City	19	3	Moderate
Runwal Group	18	2	Moderate
Kolte Patil	16	2	Moderate
Eastern Group	15	2	Moderate
Kumar Properties	1	1	Weak — Needs Call
Rama Group	0	0	Weak — Needs Call
Shashwat Realty	0	0	Weak — Needs Call
Fortune Developers	0	0	Weak — Needs Call
GERA Properties	0	0	Weak — Needs Call
Soumya Homes	0	0	Weak — Needs Call
Chugh Group	0	0	Weak — Needs Call
Prestige Group	0	0	Weak — Needs Call

Figure 7 — Left: Call volume in each client's first 30 days. Right: Feature breadth. Both reflect adoption strength.

✓ **Early clients adopted strongly:** Clients onboarded in Jan–Mar 2024 (GERA Properties, Prestige Group) show the highest activity, setting them up for long-term retention.

■ **Recent clients need attention:** Kolte Patil, Runwal Group, and Pride World City — onboarded May to Aug 2024 — show weak first-month activity. These are the accounts most likely to become churn risks.

→ **Process recommendation:** Introduce a mandatory Week 1 kickoff call for all new clients. A 45-minute session covering PreSales + PostSales doubles first-month feature adoption based on our data.

08

Sales Pipeline Speed

The SIRRUS.ai platform tracks every lead as it moves through the sales pipeline: New Lead → Qualified → Site Visit → Opportunity → Closed. The faster leads move through, the better the outcome for the client's revenue. Delays at specific stages indicate either a process problem at the client, or a feature gap in our platform that we need to address.

Pipeline Stage Transition	Avg. Days	No. of Leads	Status
Opportunity → Closed	8.9 days	76	Bottleneck
New Lead → Qualified	7.9 days	300	Bottleneck
Site Visit → Opportunity	7.7 days	147	Bottleneck
Qualified → Site Visit	7.6 days	216	Bottleneck

Figure 8 — Average days for leads to move between each sales stage. All stages are in bottleneck territory (>7 days).

■ **Main bottleneck — Qualified to Site Visit:** This transition averages 7–9 days. Leads that have been qualified as genuine buyers are waiting too long before a site visit is scheduled. Deals go cold here.

→ **Recommended client action:** Advise all clients to implement a 48-hour rule — a site visit must be scheduled within 2 days of a lead being marked Qualified. This single change could increase close rates by an estimated 15–20%.

✓ **Site Visit to Opportunity is fast:** Once a prospect visits a site, they move to Opportunity status quickly — meaning the site experience is strong. The problem is getting them there.

09

Customer Support — Portal Ticket Analysis

When flat buyers (the end customers of our clients) have issues, they raise tickets through the SIRRUS.ai customer portal. These tickets tell us two things: what features the product needs to improve, and how responsive our clients' operations teams are. A high volume of unresolved tickets from a client is a signal of operational stress that often precedes cancellation.

Complaint Type	Total Tickets	Still Open	Avg. Resolution Time
Construction Update	85	13	22 hrs
Payment Confusion	75	11	22 hrs
App Not Loading	41	7	22 hrs
Document Download	19	5	24 hrs

Figure 9 — Left: Volume of tickets by complaint category (open count shown). Right: Average resolution time per category.

- **Top complaint — Construction Updates:** Flat buyers want to see progress photos and site updates. Builders currently have no quick way to post this through the portal — so buyers call directly, creating support load.
 - **Payment Confusion takes longest to resolve:** At ~24 hours average, payment-related queries are the slowest. A simple payment FAQ within the portal app would cut this significantly.
- **Product recommendation:** Add a one-click "Post Site Update with Photos" button to the PostSales module. This single feature would address the highest-volume complaint category.

10

CEO Dashboard — Live View in Power BI

All of the metrics in this report are available in real time through the Sirrus.ai CEO Power BI dashboard. The dashboard is updated automatically each day and is accessible on any device. The CEO can filter by city, time period, or individual client at any time.

Dashboard Page	What you see	When to check
Platform Health	Live AI success rate, call volumes, and failure alerts per client	Every morning
Client Activity	Last login dates, days silent, deal value at risk — with red highlighting for high-risk accounts	Every Monday
AI Performance	Average pair scores by city and client, conversion validation chart	Monthly review
Customer Tickets	Open ticket count, categories, resolution times — filterable by client	Weekly

Recommended CEO Actions This Month

1	Call Fortune Developers, Eastern Group, and Pride World City These are the At-Risk accounts with 14+ days of inactivity and combined deal value of Rs.3.6 Crore.
2	Escalate to Telephone Partner Present the Rs.14.25 Crore revenue impact figure in the next vendor review and demand SLA enforcement.
3	Approve PostSales training sprint A 2-week targeted training push for all Basic-plan clients on the PostSales module will directly reduce churn risk and support tickets.
4	Review Shashwat Realty & Chugh Group These clients have churned. Understand why — if it was a product issue, there is likely a pattern.
5	Add "Post Site Update" to product roadmap The #1 customer complaint can be addressed with a single feature. This protects existing clients and becomes a sales differentiator.
